Notes: Unweighted sample sizes and weighted prevalence. Statistical significance is from a survey design-based Pearson chi-square test of the null hypothesis that there is no association between fee structure and geography or payment model (i.e. the categorical variables are independent).

Supplemental Table S2 Area-Level Demographics by Fee Structure

Notes: Weighted proportions and means. Statistical significance from survey-weighted F-test of the null hypothesis that the mean area-level demographics are equal across physician fee structure (i.e. there is not at least one pairwise difference). §Area level demographics are measured at the forward sortation area level (first three digits of the postal code).
