2
3 Does starting an electronic medical record (EMR) affect family
4 physicians' billings or payments?
5
6

7 BACKGROUND

8
9 Canadian primary care physicians lag in the adoption of
10 information technology, ranking last out of eleven
11 industrialized countries in their use of electronic medical
12 records (EMRs).¹ Several barriers to the adoption of EMRs within
13 primary care have been identified including confusion with the
14 array of products available in the market, lack of expertise
15 with EMR, security and privacy concerns, costs of
16 implementation, impact of work flow and loss of productivity.²⁻⁵
17
18 Some of these barriers have been addressed through programs such
19 as OntarioMD, where financial support and coaching is provided
20 to physicians to assist with converting from paper
21 charts/records to EMRs.⁶
22
23 Converting paper records into to an EMR requires additional non-
24 clinical work for family physicians (FPs) and their staff.^{4,5}
25
26 However, the impact of starting an EMR on productivity and
27 income has been examined in very few studies. A case study using
28 qualitative data for an electronic health record (EHR)
29 implementation in California found the costs of EHR were
30 recovered by a practice within about 2.5 years after
31 implementation after which they continued to see improvements in
32 their clinic profits.⁷ Another American study which measured the

2
3 effect of EHR implementation by examining episodic treatment
4 groups based on case-mix adjusted payments to providers found no
5 impact on short-term cost per episode.⁸ While concern persists
6 that starting an EMR will affect productivity and potentially
7 income, no studies have evaluated changes in billings or
8 physician income related to starting an EMR in Canada.
9

10 For many FPs in Ontario EMR adoption coincided with primary care
11 reform.⁹ In the past decade, the Ontario Ministry of Health and
12 Long Term Care (MOHLTC) introduced a number of new primary care
13 enrolment models starting with Family Health Networks (FHNs)
14 which include a base payment per patient for the provision of
15 comprehensive care (capitation) plus incentives, premiums and
16 bonuses for preventive care and some chronic disease
17 management.¹⁰ Family Health Groups (FHGs) were then introduced
18 and they are an enhanced fee-for-service model. The FHGs offer
19 fee-for-service (FFS) payments plus bonuses and incentives for
20 achieving targets, such as the proportion of patients receiving
21 preventive care. Family Health Organization (FHOs) were
22 developed later also based on capitation based physician
23 payments. Finally Family Health Teams (FHTs) were funded which
24 expanded interdisciplinary care within a family practice. The
25 introduction of these new payment models has had a significant
26 impact on FP incomes since 2005.¹¹

1
2
3 We wanted to examine changes to FP's billings and payments after
4 they started their EMR. However, both primary care delivery
5 model change and starting an EMR have the potential to impact FP
6 billings. Therefore, our overall objectives were to separately
7 examine the impact of primary care model change versus starting
8 an EMR on FP billings and payments.
9

17 METHODS

19 We conducted a retrospective before and after study of FP office
20 visit billings and payments using the date they started using
21 the EMR or the date they changed from a fee-for-service (FFS)
22 type payment model, (traditional FFS or FHG) to a capitation-
23 based model (FHN, FHO, FHT) as the index dates.
24

25 The Electronic Medical Record Administrative data Linked
26 Database (EMRALD)
27

28 The EMR-related information used in this study came from a
29 linkage of EMR data from enrolled physicians to Ontario health
30 administrative data (EMRALD).¹² EMRALD was developed using a
31 mechanism to extract and securely transfer data from Practice
32 Solutions® EMR and linking it to the health administrative data
33 held at the Institute for Clinical Evaluative Sciences (ICES).
34 Practice Solutions® EMR is used by community-based Ontario FPs
35 and it is the most frequently adopted government supported EMR
36 software vendor in Ontario¹³. There are currently 183 community-
37 based FPs contributing their primary care data to EMRALD.

1
2
3 For this study the EMRALD database was linked to the Ontario
4 Health Insurance Plan (OHIP) database of physician fee-for-
5 service billings and shadow billings. Physicians were linked by
6 encrypted OHIP billing numbers and patients were linked by ICES
7 key numbers which is an encrypted form of health card number.
8 No identifying information was used.
9

10 Study Cohorts

11 To be included in the pre-post analysis EMRALD FPs had to be
12 eligible to bill OHIP at least 18 months prior to and after the
13 date they started their EMR. The OHIP Corporate Provider
14 Database (CPDB) was used to determine OHIP billing eligibility.
15 As well, all follow up was terminated at March 31, 2011, so
16 EMRALD physicians who did not start their EMR 18 months prior to
17 this date were also excluded. Of the 183 physicians currently in
18 EMRALD, 68 FPs did not meet the inclusion criteria: 14 FPs had
19 less than 18 months of billings after their EMR start date, 39
20 were not eligible because they did not have 18 months prior to
21 their EMR start date and 15 had both insufficient look back and
22 follow up time.
23

24 Model change cohort

25 The analysis of the effect of changing from FFS to a blended
26 capitation model was limited to physicians who first switched to
27 a capitated model more than 18 months prior to going on an EMR
28
29
30
31
32
33
34
35

60

1
2
3 (N=42). This ensured that their 18 month follow up period after
4
5 switching models did not include their EMR start date.
6

7
8 Stable model, EMR change cohort
9

10 To get the most accurate estimate of the effect of an EMR on
11
12 billings we constructed a cohort of physicians whose payment
13
14 model did not change during the 18 months prior to and the 18
15
16 months following their EMR start date. This cohort included the
17
18 42 physicians in the model change cohort (because their model
19
20 change occurred more than 18 months prior to their EMR date)
21
22 plus 22 physicians whose model did not change in the data or
23
24 changed more than 18 months following the EMR start date (N=64).
25
26
27

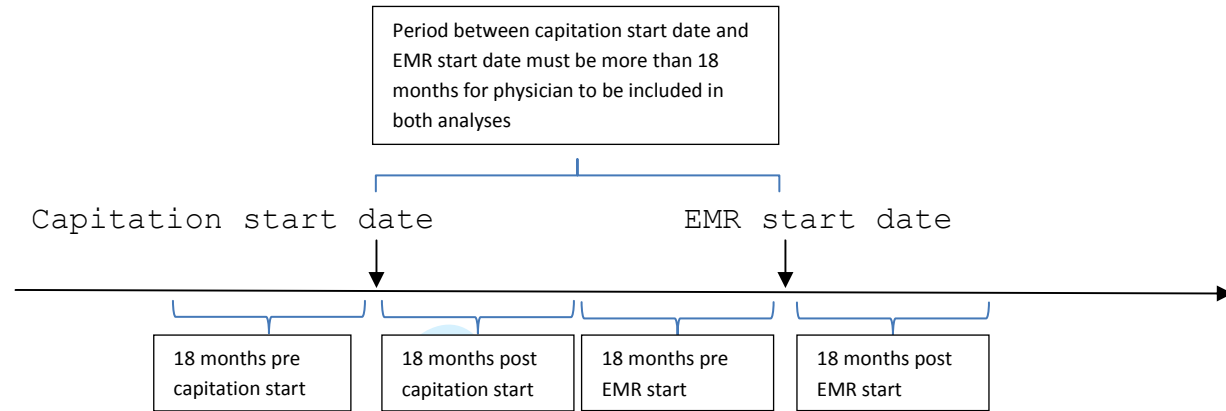

28
29 Time frames
30

31 Two time frames were used. For the study examining the effect of
32
33 changing from FFS to capitation, the date on which the physician
34
35 switched from FFS to capitation had to be more than 18 months
36
37 prior to his/her EMR start date. The look back and follow up
38
39 periods were 18 months prior to and 18 months after the
40
41 capitation start date.
42
43

44
45 For the pre-post EMR analyses maximum follow up date was March
46
47 31, 2011, thus the latest EMR start date included in the study
48
49 was 18 months prior to March 31, 2011. EMR start date was
50
51 defined as the day in which there were at least five progress
52
53 notes with billings in the FPs EMR record. Look back and follow
54
55
56
57
58
59
60

up periods were 18 months prior and 18 months after each EMR start date.

See diagram below.

Note: Post capitation and pre-EMR periods can and do overlap.

Definition of Office Visit Billings and Payments

Office visits included all OHIP billings by EMERALD FPs for assessments and consultations, excluding those which took place in the emergency department, hospital, long-term care facility or the patient's home. Billings for procedures were also excluded. Office visit payment is simply the sum of all OHIP FFS payments made for office visits as defined above.

To estimate the impact of switching models or starting an EMR on overall MOHLTC payments, not just FFS payments, we used data generated for the report "Payments to Ontario Physicians from Ministry of Health and Long Term Care Sources"¹¹. This data includes FFS payments plus payments from a number of other sources and mechanisms such as alternate payment plans, capitation and a variety of incentives, bonuses and premiums.

1
2
3 This data is calculated for individual physicians, but only
4 available for an entire fiscal year. Thus, the pre-capitation or
5 pre-EMR year is defined as the full fiscal year prior to, but
6 not including, the capitation or EMR start dates. Similarly, the
7 post-capitation or post-EMR year is the first full fiscal year
8 after the year containing the capitation or EMR start date.
9

17 Generalizability

19 To examine the generalizability of results using the EMRALD
20 database we compared all EMRALD physicians (N=183) to all other
21 active general practitioners (GPs) and FPs in Ontario in 2010/11
22 (N=11,385) with respect to their age, sex, location of
23 undergraduate medical training, practice rurality¹⁴, proportion
24 of their billed visits located in the emergency department and
25 full time affiliation with a Patient Enrolment Model^{9,10}. We also
26 compared the patients who visited EMRALD physicians (N=286,177)
27 to all other FPs in primary care models with rostered patients
28 (N=9,728,198) and who had used health services in Ontario in the
29 past seven years with respect to patient age, sex, socioeconomic
30 status (SES)¹⁵, rurality¹⁴ and comorbidity¹⁶. We then examined
31 practice characteristics such as the proportion of patients with
32 diabetes, hypertension, chronic obstructive pulmonary disease
33 (COPD), asthma, congestive heart failure (CHF) and mental health
34 issues.
35

57 Pre-post analyses

1
2
3 The number of office visit billings was summed by physician for
4 each month. Then the monthly average was calculated across all
5 physicians in a given study cohort. Recognizing that situations
6 such as maternity, illness or parental leave could result in a
7 drop in billings erroneously attributed to either model change
8 or EMR start, the average for each month only included
9 physicians who had at least 50 billings during the month.

10 The average number of office visit billings was estimated before
11 and after either the EMR start date or the model change date.
12 Means pre and post were calculated and a t-test was undertaken
13 to determine statistical significance¹⁷. Also, the slope pre and
14 post dates were calculated and tested to determine whether they
15 were significantly different from null¹⁷.

16 For the payments from all MOHLTC sources, the outcome measures
17 are the mean annual payments from all sources pre and post
18 capitation or EMR start.

19 RESULTS

20 ***Generalizability of EMRALD Family Physicians***

21 A comparison of EMRALD FPs and to all Ontario GP/FPs in 2011 is
22 provided in Table 1. EMRALD FPs were younger, more likely to be
23 female, not be an international medical graduate and more likely
24 to participate in a patient enrolment model. There was a higher
25 proportion of EMRALD FPs from rural and suburban locations.

26 ***Generalizability of EMRALD Patients and Practices***

1
2
3 A comparison of EMRALD patients to all Ontario rostered patients
4 in 2011 is provided in Table 2. There were no significant
5
6 differences in distribution by patient age and sex between
7
8 EMRALD patients and all Ontario rostered patients. There was a
9
10 higher proportion of EMRALD patients in the highest SES income
11
12 quintile and EMRALD patients were more likely to live in rural
13
14 and suburban regions. There were slightly more EMRALD with no or
15
16 lower comorbidity and lower proportions with diabetes or
17
18 hypertension. We did not find any difference between EMRALD
19
20 patients and all other rostered Ontario patients with respect to
21
22 the proportion with a previous acute myocardial infarction,
23
24 asthma, congestive heart failure, chronic obstructive pulmonary
25
26 disease or mental health issues.
27
28
29
30
31
32

33 ***Starting an EMR for FPs who did not change their primary care***
34 ***delivery model***
35
36

37
38 For EMRALD FPs who did not change their primary care model
39
40 during the 18 months prior to or after starting an EMR (N=64),
41
42 the average number of office visit billings and payments per
43
44 month before and after starting an EMR is provided in Figure 1.
45
46 The average number of office billings and payments declined
47
48 significantly prior to the implementation of the EMR ($p < 0.01$).
49
50 However, after EMR implementation the average number of billings
51
52 and payments per month stabilized ($p > 0.1$).
53
54
55
56
57
58
59
60

1
2
3 ***The effect of switching from FFS to a blended capitation payment***
4
5 ***model***
6

7
8 The average number of monthly office visit billings and payments
9
10 for EMERALD FPs who were in a capitation model 18 months before
11
12 their EMR start date, but prior to this changed from a FFS to
13
14 capitation payment model (N=42) is provided in Figure 2. While
15
16 there was a decline in monthly office billings prior to changing
17
18 payment models, it was not statistically significant ($p>0.05$).
19
20 However, the decline in office billings after changing payment
21
22 models was highly significant ($p<0.0001$), with a decline in
23
24 monthly payments to about 25% of their pre-capitation level.
25
26
27

28
29 ***Total payments***
30

31 The total payments from all MOHLTC sources increased after
32
33 starting an EMR by 20.9% for the FPs who did not change their
34
35 primary care model within 18 months of starting an EMR. There
36
37 was a larger percentage increase of 44% in total MOHLTC payments
38
39 for FPs who changed from a FFS to capitation model.
40
41

42 We compared the pre-post mean annual payments from all MOHLTC
43
44 sources amongst the EMERALD FPs to all other Ontario GP/FPs in
45
46 Table 3. There was an increase in the annual payments in all
47
48 instances for both EMERALD FPs and GP/FPs in Ontario. The EMERALD
49
50 FPs had a larger increase in payments after starting an EMR
51
52 compared with all other Ontario GP/FPs in the same time
53
54 interval, except in 2007 and 2009. The overall weighted mean
55
56
57
58
59
60

1
2
3 payment for all MOHLTC sources increased after starting an EMR
4
5 for EMERALD FPs.
6

7
8 INTERPRETATION
9

10 We found that when FPs changed from a FFS to capitation payment
11
12 model, there was decline with their office based billings and
13
14 payments after this change. However, there was an increase in
15
16 the MOHLTC payments from all sources after changing to a
17
18 capitation model. While there was a decline in office based
19
20 billings and payments prior to starting an EMR, this stabilized
21
22 after starting an EMR. After starting an EMR, there was an
23
24 increase in MOHLTC payments from all sources, similar to the
25
26 increase seen amongst all Ontario FPs.
27
28

29 FPs participating in capitation models are supposed to submit
30
31 their claims (shadow bill). In an effort to encourage the
32
33 submission of shadow billing, the MOHLTC provides a small
34
35 proportion of the payment for these claims as an incentive.^{18,19}
36
37

38 However, there is work associated with submitting billing
39
40 information and FPs may not bother to submit claims for all
41
42 their patient encounters. The decline prior to starting an EMR
43
44 is likely a continuation of the decline in billings after
45
46 switching models. In other words, this decline is happening
47
48 prior to our 18 month stable model cut-off. Total payments from
49
50 all MOHLTC sources increased after starting an EMR, but this was
51
52 generally true for all FPs in Ontario over time¹¹. One
53
54
55
56
57
58
59
60

1
2
3 possibility for this plateau of billings after starting an EMR
4
5 is that using the EMR-provided billing features making
6
7 submitting claims easier. Also, during this time more billing
8
9 options were introduced for FPs participating in the newer
10
11 primary care models and this stabilization may reflect uptake of
12
13 these new codes.
14
15

16
17 For FPs in Ontario, billings or claims do not equal income. Many
18
19 physicians now receive the majority of their payments from
20
21 capitation for rostered patients. Additional sources of revenue
22
23 for FPs include bonus payments, rural practice incentive
24
25 payments, and other global payments. Physicians may also receive
26
27 payments made for services not covered by the MOHLTC, such as
28
29 cosmetic procedures and block fee payments directly from
30
31 patients and which are not included in these analyses. However,
32
33 it is not likely these payments are related to FP EMR use.
34
35

36
37 Payments to FPs also do not include the costs associated with
38
39 running a practice, including the costs associated with
40
41 converting to an EMR. Financial help was available to FPs via
42
43 OntarioMD for the start up costs. Nevertheless, there is still
44
45 much non-clinical work and time taken by FPs and their staff
46
47 when they adopt an EMR and we did not estimate the costs
48
49 associated with this learning curve.
50
51

52
53 A systematic review of FPs or primary care practices on the
54
55 potential benefits and limitations of EMRs found healthcare
56
57
58
59
60

1
2
3 system structural benefits demonstrated through the conversion
4 from paper records to EMRs, with improved legibility,
5 encouraging patient questions and completeness of encounters,
6 keeping medical records up to date and improving the quality of
7 the medical record overall.²⁰ Another systematic review revealed
8 some, but limited positive EMR impact on physician's practices
9 in certain areas including prescribing support, disease
10 management, work practice and preventive care.²¹ A recommendation
11 from this review is for studies to demonstrate value for money.

22 Limitations

23
24 Our study includes a convenience sample of FPs in Ontario who
25 are different on some characteristics from other FPs in Ontario.
26 We include a higher proportion of rural FPs and this may have
27 some independent influence on billings. Currently data about EMR
28 use for all Ontario GP/FPs is not available. For the total
29 MOHLTC payment analysis, the comparison with all other GP/FPs in
30 Ontario included physicians who also started and use an EMR.
31 This is not a comparison to non-EMR users. We also only included
32 one EMR vendor.

33 Conclusions

34 We found that FPs billings and payments did not decrease after
35 starting an EMR. There was a decline in billings when FPs
36 changed from FFS to a capitation model, but no decline in their
37 MOHLTC payments. The overall weighted mean payment for all
38

Table 1 Comparison of EMRALD family physicians with all other General Practitioners/Family Physicians in Ontario in 2011

Characteristic	EMRALD Physicians		All Other Ontario GP/FPs	
	N	%	N	%
Total	183	100.0	11,385	100.0
Sex				
Male	85	46.4	6,833	60.0
Female	98	53.6	4,552	40.0
missing	0	0.0		0.0
Total	157	100.0	11,385	100.0
Age group				
Under 35 years	35	19.1	1,094	9.6
35-44 years	63	34.4	2,617	23.0
45-54 years	38	20.8	3,312	29.1
55+	47	25.7	4,362	38.3
Mean age (years)	44.9		50.6	
Medical training location				
Canada	157	86.6	8,731	76.7
US and International	16	8.3	2,647	23.2
missing	10	5.1	7	0.1
Average number years in practice	14.0		17.0	
Rurality				
Rural	35	19.1	850	7.5
Suburban	40	21.9	1,871	16.4
Urban	108	59.0	8,664	76.1
More than 25% of visits in the Emergency Department (%)		15.3		13.7
Full time affiliation with a Patient Enrolment Model group on March 31, 2011	173	94.5	6,866	60.3

Table 2 Comparison of EMRALD patients to patients of all other Ontario General Practitioners/Family Physicians in 2011

	EMRALD patients (%)	Patients of other Ontario GP/FPs (%)
Male	45.4	47.4
Female	54.6	52.6
Age group		
0-4	6.3	4.0
5-17	13.4	14.6
18-29	14.9	15.1
30-44	21.6	20.5
45-64	28.3	30.2
65-74	7.7	8.3
75-84	5.3	5.3
85+	2.5	2.0
Mean age	40.1	40.8
SES Income Quintile		
1 - Lowest	16.8	17.7
2	17.7	19.3
3	18.9	20.3
4	21.0	21.7
5 - Highest	23.9	20.7
Unknown/missing	1.8	0.3
Rurality		
Rural	14.9	5.5
Suburban	20.0	17.6
Urban	65.0	76.9
Number of Adjusted Clinical Groups (Comorbidity)		
0-no comorbidity	7.6	6.2
1-5	48.0	45.7
6-9	35.9	39.4
10+-high comorbidity	8.5	8.6
Chronic Conditions (%)		
Previous AMI	1.3	1.3
Asthma	14.0	14.7
CHF	2.1	1.8
COPD	6.3	6.3
Diabetes	8.3	9.7
Hypertension	20.7	22.9
Mental health issue	21.4	20.8
Chronic condition	46.5	50.4

Figure 1. Before and after starting an EMR, EMRALD physicians who did not change primary care model 18 months prior to starting on an EMR, (average number of billings and payments per month)

* , $p \leq 0.05$; † - before and after measures significantly different, $p \leq 0.05$; CL=confidence limits

Figure 2. Before and after switching from fee-for-service (FFS) to capitation, EMERALD physicians who were in a capitated model at least 18 months prior to starting on an EMR, (average number of office billings or payments per month)

* , $p \leq 0.05$; † - before and after measures significantly different, $p \leq 0.05$; CL=confidence limits

For Peer Review Only

Table 3 Comparison of mean annual payments from all sources pre-post EMRALD family physicians (FPs) compared with all Ontario general practitioners/family physicians (GP/FPs)

EMR start year	EMRALD FPs				All Ontario FP/GPs				
	Number of physicians who started on EMR this year	Mean total payments from all sources for pre-EMR year - EMRALD FPs	Mean total payments from all sources for post-EMR year - EMRALD FPs	Percentage Change	N (all other GP/FPs)	Mean total payments from all sources for same year as pre EMR year - all other Ontario GP/FPs	N (all other GP/FPs)	Mean total payments from all sources for same year as post EMR year- all other Ontario GP/FPs	Percentage change
2005	18	191,341.92	351,250.58	83.6	9,865	183,570.21	10,046	243,426.91	32.6
2006	38	200,836.27	256,882.30	27.9	10,129	214,025.09	10,149	248,381.12	16.1
2007	8	196,967.16	210,036.06	6.6	10,046	243,426.91	10,352	273,961.63	12.5
2008	12	257,109.93	347,937.54	35.3	10,149	248,381.12	10,666	285,366.01	14.9
2009	26	271,144.45	275,189.77	1.5	10,352	273,961.63	10,872	279,978.02	2.2
Overall mean (weighted)		223,399.46	285,240.30	27.6		233,100.21		266,678.94	14.4
